Next.js Billing Dashboard

What is it?

A secure web dashboard where a team reviews invoices, customers and revenue in one place.

Does it run? Yes, live.

Open

nextjs-dashoard-psi.vercel.app

Sign in

Supabase Auth login protects every dashboard page

Click through

Overview, then Customers, then Invoices

Three things it does

Overview

Revenue, invoice totals, latest invoices

Customers

Browse and review every customer

Invoices

Search, filter, create, edit, delete

Why this stack?

Next.js

Server pages and actions: fast, and secrets stay on the server

Supabase Auth

Ready-made secure sign-in and sessions

PostgreSQL

Reliable data for invoices and customers

Rules, privacy and design

Business rules

Sign in first. Failed saves show an error, never fake success.

POPIA basics

Customer data behind login, credentials server-side, no patient data mixed in

Design

Inter font for easy-to-read numbers. Blue conveys trust and finance.

Speaker script (about 60 seconds)

1. Next.js Billing Dashboard (10s) Say it in one sentence: A secure web dashboard where a team reviews invoices, customers and revenue in one place. Built by Ammara Badat.

2. Does it run? Yes, live. (12s) Open the live link. Sign in. Show overview, then customers, then search and create an invoice. Use the new navigation to move between pages.

3. Three things it does (12s) Overview, customers, invoices. That is the whole story. Patient data is deliberately not here: it lives only in the clinic dashboard.

4. Why this stack? (12s) Next.js keeps database credentials server-side. Supabase Auth saves us building login ourselves. PostgreSQL is the existing trusted data source. Tailwind keeps styling consistent.

5. Rules, privacy and design (14s) Business rules: login required, honest errors. POPIA basics: protect personal information, collect only what is needed, keep secrets server-side. Inter is highly legible for figures; blue signals trust. Honest note: this is not a compliance certificate.
