Family Clinic Dashboard

What is it?

One secure clinic platform where patients, doctors, reception and pharmacy each see only what they need.

Does it run? Four live doors

Patients

/medi-clinic

Admin

/medi-clinic/dashboard

Doctors

/medi-clinic/doctors

Pharmacy

/medi-clinic/pharmacy

Patient journey

Book

Pick a provider and shift online

Upload

Identity, history and invoices to a private bucket

Join a plan

"Enquire about" a Care Plan opens the Medical Aid dashboard

Track

Appointments, prescriptions, claims, card wallet, own profile editing

Doctor dashboards

Pick your doctor

After sign-in a pop-up asks which doctor you are

Own dashboard

Today, coming up, patients and weekly shifts for that doctor

Mon to Fri shifts

Shifts are entered and shown as a day range

Switch any time

Header button changes doctor

New: calendar, live updates and shortcuts

Calendar

Week grid per doctor with available hours shaded and hover details

Live updates

Pages refresh by themselves; the bell shows what changed

Shortcuts

T theme, L language, G then a letter to jump; ? lists them

Tour and theme

Guided tour, dark and light mode, English and Afrikaans

Why this stack?

Supabase Auth

Trusted roles: owner, doctor, patient, pharmacist

RLS policies

The database itself blocks access to other patients

Private Storage

Documents open only via short-lived signed links

Business rules and POPIA basics

Least privilege

Each role sees the minimum: stock managers get no patient charts

Protect data

Masked cards only, no hard deletes, signed notes never rewritten

POPIA basics

Consent, minimum data, secure storage, limited access, legal review before real data

Run the clinic safely

Audit log

Owner and admin see who changed what, and when; personal values are never copied

Stock alerts

Low stock and batches expiring within 30 days

No double booking

The database refuses two bookings for one provider at one time

Reminders

A daily job e-mails and texts patients before their appointment

Checked on every push

Security tests

Row-level security tested on a real PostgreSQL with a second user

Browser tests

The live site is tested after each deploy: sign-in redirects, exports, install

Lighthouse

Accessibility 96 to 100, performance 99 to 100, best practices 100

Design choices

Colour

Midnight, navy and royal blue from the clinic logo: calm, clinical, trusted

Font

Lusitana serif for warm headings, Inter for clear interface text

Next

Connect the PayFast sandbox checkout, refunds, doctor description cards

Speaker script (about 60 seconds)

1. Family Clinic Dashboard (10s) Say it in one sentence: One secure clinic platform where patients, doctors, reception and pharmacy each see only what they need.

2. Does it run? Four live doors (10s) Base link nextjs-dashoard-psi.vercel.app, then the Family Clinic card. Each door has its own sign-in. Demo patient: patient1@gmail.com.

3. Patient journey (10s) Patient books, uploads documents, tracks appointments and prescriptions, and can enquire about a Care Plan which opens the Medical Aid dashboard.

4. Doctor dashboards (12s) Sign in as a doctor. A pop-up asks which doctor. Show that doctor's schedule and the Monday to Friday shifts, then use Switch to pick another. Sample data is labelled when the database has none.

5. New: calendar, live updates and shortcuts (12s) Open Calendar and hover an appointment; choose a doctor to see shaded availability. Keep two windows open to show the bell. Press the question mark for keyboard shortcuts.

6. Why this stack? (10s) Roles live in trusted Auth metadata. Row-level security enforces access in the database. Storage is private. Next.js keeps keys server-side.

7. Business rules and POPIA basics (10s) Least privilege, protected records, audit-friendly history. Honest: legal review is needed before real clinical data; we do not claim certification.

8. Run the clinic safely (12s) Sign in as the owner and open Audit log: every change with who and when, but no personal values. On the pharmacy page show the stock alerts. Mention that the database refuses a double booking, and that a daily job sends reminders by e-mail and SMS once the keys are added.

9. Checked on every push (10s) GitHub runs the security tests on a real Postgres, builds and type-checks the app, then browser tests and Lighthouse check the live site. Say the numbers: accessibility 96 to 100, performance 99 to 100.

10. Design choices (8s) Blues from the logo signal trust. Lusitana headings and Inter text. Close with next steps.
